Hiring Team

Enterprise Sales, Solutions Engineering

Notion

San Francisco, CA

Dear Notion Hiring Team,

I have been building production systems on the Notion API for the past year, so when Notion launched the Developer Platform on May 13 and I saw Workers, the ntn CLI, Database Sync, and the External Agents API announced in the same week, my first thought was not "interesting product announcement" but "I know exactly what I would build with that on day one." That is the disposition I would bring to your enterprise customers as a Solutions Engineer: someone who has already shipped the thing they are about to demo.

At Thoughtful AI, I delivered **63% of company net new ARR** during a year when the business grew 3x, owning the complete pre-sales cycle from first call through production sign-off. The technical role was real: I built the company's first GenAI system (a hybrid-RAG eligibility verification engine that hit 95% accuracy in two days), ran 8-20 hour on-site discovery workshops at health systems, wrote pseudo-code specs that engineers built directly from, and personally executed test plans before every production deployment. The funnel number that came out of that work was a **96% prospect-to-proposal conversion rate**. That is what it looks like when an SE understands the product deeply enough to scope it honestly.

When Thoughtful merged into Smarter Technologies and I moved into the Director SE role, I built the API integration platform that made it possible for a two-person team to manage **61 simultaneous enterprise deals across \$31.8M in active pipeline**. The centerpiece was the Notion Meeting Intelligence system: a multi-agent pipeline that processed every sales call in real time, extracted deal intelligence across five categories, and wrote structured records directly into Notion workspaces via the API, with bidirectional sync to Salesforce for executive visibility. I built 76 prospect workspaces, each with isolated deal environments, custom dashboards, and automated stage tracking. The system ran live on a pipeline that included a \$30-40M health system design partnership and two closed enterprise deals. I built it because I needed it, and it worked because I kept iterating against real data every day. That comfort with Notion as a build platform predates the Smarter Technologies work: at Thoughtful AI I served as the company's Notion workspace admin, configuring linked databases, rollup formulas, permission hierarchies, and filtered views for a cross-functional team. When Smarter Technologies shut

down in April 2026, I was retained as the only non-Product or Engineering employee from an 85% workforce reduction and promoted to VP of Solutions at AccessHealthcare within my first month.

The enterprise sales motion I would bring to Notion's customers is the one I have been running myself. I know what a skeptical CTO sounds like when they are actually interested, what a security review from a CISO needs to contain to move forward, and how to scope an integration without overpromising what the product will do. I also know, from the builder side, how to use Notion's new primitives in ways that make those conversations shorter: a Workers deployment that syncs a customer's CRM into their Notion workspace before the evaluation period ends is a more compelling proof point than any slide. I am in San Francisco, available to anchor in-person, and ready to start building reference architectures for the enterprise accounts on the first day I am in the door.

I would welcome the chance to talk through what an enterprise SE motion looks like at Notion's scale and what I would focus on in the first 90 days.

Sincerely,

Dan Mathieson
