Dear Anthropic Hiring Team,

The six years before I moved into solutions engineering were revenue analytics: consumption-based forecasting at FanDuel, post-acquisition strategic metrics at Action Network, P&L ownership at Google. That analytical foundation is how I was able to pick up GTM quickly enough to be elevated to a VP within 1 year of my move into pre-sales work. My understanding of the customer from a data perspective first and foremost is why two people could manage 62% of total pipeline at Smarter Technologies, why the pricing models I built for contracts up to \$40M held up in C-suite conversations, and is why the ICP scoring framework I designed covered 99 enterprise deals with defensible logic approved by the CEO. I am writing because the GTM Strategy and Operations role at Anthropic is where that analytical background belongs, and because I have spent the last three years as a customer building production systems on Claude.

That analytical career started with six years of building revenue data infrastructure from the ground up. At FanDuel I owned the revenue cadence: daily automated C-suite reports, weekly revenue syncs with senior leadership, and a Markov Chain Monte Carlo simulation that segmented the user base into 18 cohorts (6 play-style types across 3 contest entry-fee bands) and achieved a 2% revenue error rate, a 5x improvement over the prior best model. Daily fantasy sports is structurally identical to API token consumption: revenue is a function of entry volume, high-intensity users generate disproportionate revenue, and the forecast depends on retention within spending cohorts. At Google I owned the GSuite revenue forecast in BigQuery covering 500 million users, ran the bi-weekly revenue reconciliation meetings with finance leadership, and produced the monthly forecast review notes that rolled into quarterly earnings reporting. Revenue analytics at that scale is GTM analytics: you are building the measurement infrastructure that tells the business what is working, who is buying, and where to allocate resources.

At Action Network I stepped into the Director of Analytics role leading a seven-person team through an acquisition and a full strategic reorientation. I built the Value Clicks north star metric - correlating content consumption to downstream affiliate conversion - that realigned both the content and product teams' roadmaps and drove 70% year-over-year revenue growth. Then built the full 3-5 year business forecast tops-down and bottoms-up simultaneously: the tops-down model gave leadership a market-sizing anchor, the bottoms-up gave operations something they could actually manage against. That combination of metric design, team leadership, and long-range forecasting under ambiguity is exactly what a cross-cutting special projects function needs.

At Smarter Technologies those six years became GTM operations directly. The RevOps function was thin, so I filled it: deal-specific pricing models for contracts from \$250K to \$40M, Salesforce pipeline

dashboards for VP and CEO reviews, ICP scoring across 99 deals, and pipeline hygiene across 61 active accounts simultaneously. Two people covered 62% of total company pipeline through the analytical infrastructure I built. The boundary between SE and RevOps was functionally blurred the entire time. I ran both because the work is the same: take complex deal data, build the analytical framework, translate it into the recommendation leadership needs to make the right call.

The third thread is that I am Anthropic's own customer. I have been spending over \$2,000 per month on API tokens for the last four months, building production agentic systems on Claude that process real enterprise deals. That means I have made real decisions about usage optimization, cost forecasting, and the ROI of different model choices under real budget constraints - I understand the consumption economics of API pricing from the demand side, not just the analyst's chair. And I have spent two years in rooms with the enterprise buyers your GTM team is selling to, which means I know what moves them from skeptical to convinced and what the reporting infrastructure needs to look like for them to trust the numbers.

The combination of six years of revenue analytics foundation, three years applying it directly to GTM operations, and three years as an active customer of the product makes this the most natural application I have written. The fact that this role is specifically structured around special projects is not incidental: a career spent connecting analytical infrastructure to business decisions across consumer products, enterprise GTM, and AI infrastructure is exactly the kind of background that is most useful when the playbook does not yet exist. I would welcome the opportunity to talk about the specific challenges the Special Projects team is working on.

Sincerely,

Dan Mathieson
