CLINICAL SUMMARY

Thyroid function is within normal limits. No evidence of hypothyroidism or hyperthyroidism. Anti-TPO antibodies are negative, making autoimmune thyroid disease (Hashimoto's) unlikely. No thyroid medication changes needed.

Lipid panel shows borderline high total cholesterol and elevated LDL with low-normal HDL and mildly elevated triglycerides. 10-year ASCVD risk calculated at 7.2% (intermediate risk). Per ACC/AHA guidelines, a discussion of statin therapy is warranted. Dietary counseling referral placed.

Recommendations: (1) Dietary modification: reduce saturated fat, increase soluble fiber and omega-3 fatty acids. (2) Increase aerobic exercise to 150 min/week. (3) Vitamin D supplementation 2000 IU daily recommended. (4) Repeat lipid panel in 3 months after lifestyle intervention before statin initiation decision. (5) Discuss statin therapy at next visit if LDL remains above 130.
